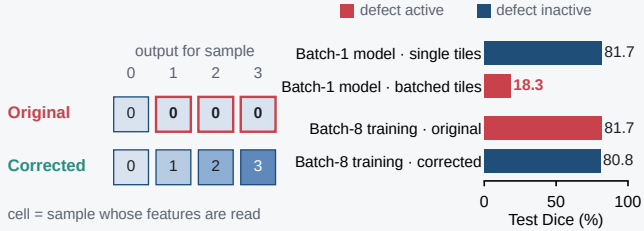
Case study DSCNet with Dynamic Snake Convolution (ICCV 2023) · DRIVE and CHASE_DB1 · 86 training runs · 5 seeds · validation-only checkpoint selection

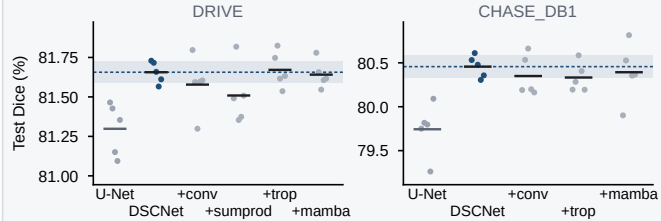
a A silent, context-dependent defect (Q1–Q2)

Gather index drops the batch offset: every sample reads sample 0



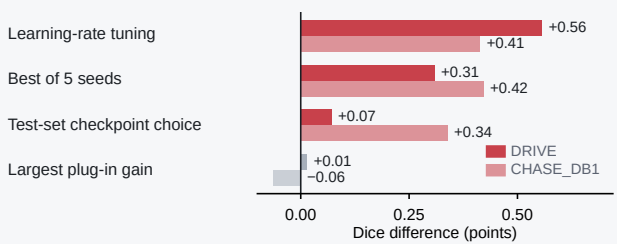
b Fair comparison of plug-in modules (Q3)

Dots: seeds; line: mean; band: DSCNet mean ± SD. No plug-in beats DSCNet



c Evaluation choices outweigh module effects (Q4)

Measured on the same runs; Dice points relative to the fair estimate



d Practices in public code (Q5)

Commit-pinned audit with file- and line-level evidence

Recommendations

- Validation-only selection
- Equal tuning budget
- ≥3–5 seeds, paired tests
- Capacity-matched control
- Batch-invariance unit test
